

SWIFT FINANCIAL

Client User Guide

A practical guide to secure, accurate day-to-day use

Version 1.0 | September 2026

Prepared for: [Client organisation]

System URL: [Production URL]

Support contact: [Name, email and telephone]

PURPOSE This guide is for authorised client staff using Swift Financial. Available menus and actions depend on the permissions assigned to each user.

Document control

Item	Details
Document owner	[Client system owner]
Application	Swift Financial - Front Office Service Activities and related modules
Version	1.0
Issued	September 2026
Audience	Tellers, operations staff, supervisors, finance staff, administrators and authorised reviewers
Review cycle	Review after each major release, workflow change or permission-model change

How to use this guide

- Start with Quick start if you are a new user.
- Use the module overview to identify where a task belongs.
- Follow the numbered workflow and complete the checks before submitting.
- Ask a supervisor before repeating, reversing or correcting a financial transaction.

SCOPE NOTE This manual reflects the application routes and workflows present in the September 2026 client build. Your organisation may hide modules that are not licensed, configured or assigned to your role.

Contents

1. Quick start
2. Account security
3. Navigating the application
4. Common screen patterns
5. Module overview
6. Registry and customer records
7. Accounts and product setup
8. Front Office operations
9. Loans and check-off
10. Batch procedures and approvals
11. Reports, statements and messaging
12. Administration
13. Troubleshooting
14. Daily operating checklists
15. Support and handover details

1. Quick start

Sign in

- 1. Open the production URL supplied by your system administrator.
- 2. Enter your email address or username and password.
- 3. Select Login. Wait for the home page and your permitted navigation areas to load.
- 4. If prompted on first sign-in, enter the temporary password and choose a new password.

PASSWORD RULES A new password must contain at least 6 characters, including an uppercase letter, a lowercase letter, a number and a symbol.

Your first five checks

Check	What to confirm
Identity	The displayed user account is yours; never work under another person's login.
Workspace	The selected module matches the task you intend to perform.
Branch/context	The applicable branch, teller, treasury, period or account context is correct.
Permissions	Only expected menus and actions are visible.
Connectivity	Lists load without a persistent error message.

Safe transaction habit

Search -> select -> verify -> enter -> review -> submit -> record the reference.

NEVER DOUBLE-SUBMIT If the screen is still processing, do not click the action again. If the outcome is uncertain, search the relevant register or transaction journal before retrying.

2. Account security

- Keep passwords private. Administrators and support staff should never ask you to disclose your password.
- Use a unique password and change temporary credentials immediately.
- Lock or sign out when leaving the workstation.
- Do not export customer or financial information unless the business purpose and storage location are approved.
- Report unexpected menus, missing permissions or suspicious activity to the system owner.

Access is role-based

The application builds the navigation menu from the signed-in user's roles and module permissions. A user may see fewer workspaces, folders and actions than a colleague. An Access denied screen means the route is controlled and has not been granted to the current user.

When sign-in fails

Message or symptom	Response
Missing fields	Enter both username/email and password.
Login failed	Check spelling and Caps Lock, then retry once. Contact the administrator if it continues.
Initial password change fails	Confirm both new-password entries match and meet all password rules.
Navigation cannot load	Select Retry. If it persists, record the time and report it.
Access denied	Return to an authorised menu. Ask the role administrator if the task is part of your duties.

3. Navigating the application

The application uses a top navigation bar, a workspace rail and a contextual sidebar. On smaller screens, use the menu button to open the navigation panel.

Area	Purpose
Home	Shows permitted workspaces and provides a starting point for common functions.
Workspace rail	Switches between major areas such as Registry, Accounts, Front Office or Administration.
Context sidebar	Shows folders and pages available in the active workspace.
Global search	Locates supported screens or records where enabled.
Page header	Identifies the current function and contains primary actions such as Add or Create.
Alerts/dialogs	Confirm success, warn about missing information or request confirmation for a sensitive action.

Responsive use

- Desktop: both navigation panels remain visible.
- Tablet: select a workspace icon to open its menu.
- Mobile: use the menu button; close the overlay after choosing a page.

4. Common screen patterns

Pattern	How to use it
Searchable customer picker	Type a supported identifier or name, wait for server results, select the correct customer and verify the retained selection.
List/register	Use search or filters, open a row for details, and use Prev/Next to move through pages.
Drawer/form	Complete required fields, scroll through the form, review, then use the fixed submit action.
Tabs	Tabs may represent transaction types or workflow stages. Confirm the active tab before acting.
Status badge	Green normally indicates active/authorised, amber pending/warning, blue informational/posted, red rejected/locked and gray neutral.
Confirmation alert	Read the full action and target. Cancel if any identifier, amount, date or status is wrong.

5. Module overview

Module	Typical functions	Typical users
Registry / Membership	Customers, members, employers, zones, divisions, linkages and file tracking	Member service and registry staff
Accounts	Customer accounts, products, charges, journals, periods, bank reconciliation and budgets	Finance and product administrators
Front Office	Teller receipts/payments, treasury, transfers, cheques, deposits, closure and end of day	Tellers and supervisors
Loaning	Loan cases, appraisal, approval, verification, guarantors, restructuring and check-off	Credit and loans teams
Command Hub	Approval requests, messages and operational utilities	Approvers and supervisors
Reports	Loan, finance, member, statutory and user-defined reports	Managers, finance and auditors
Administration	Users, roles, modules, workflows, banks, branches, locations and audit logs	System administrators
Other configured areas	Inventory, procurement/control, HR, payroll, fixed assets and microcredit	Specialist teams

PERMISSION-DEPENDENT Not every route in the installed application is necessarily enabled for production use. Follow the visible, assigned navigation rather than bookmarked or manually typed addresses.

6. Registry and customer records

Find and review a customer

1. Open Registry or Membership and choose Customers or Members.
2. Search using the available customer identifiers or name fields.
3. Select the matching record and verify name, identifier and organisational details.
4. Use the detail tabs to review information, accounts, next of kin or statements where available.

Register or amend a record

1. Select the appropriate create/register action.
2. Enter the details exactly as supported by source documentation.
3. Choose the correct branch, employer, division, zone or station linkage.
4. Check contact details and identifiers for transposition errors.
5. Submit once and record the confirmation or customer reference.

CUSTOMER IDENTITY Do not rely on name alone. Use at least one additional identifier before viewing, changing or transacting on a customer record.

Related functions

- Delegates and directors maintain authorised related persons.
- Station and branch linkage assign the appropriate organisational relationship.
- Conditional lending records product-specific conditions.
- File Tracking supports dispatch, receipt, recall and catalogue activities.

7. Accounts and product setup

Accounts contains both operational inquiries and setup data. Setup changes can affect future transactions, charges and postings, so they should be restricted to authorised staff and tested under change control.

Customer account workflow

1. Find and verify the customer.
2. Select the correct financial product and branch/context.
3. Review account identifiers, status and linked facilities.
4. Submit the registration or maintenance action.
5. Confirm the new or changed account in the register before continuing.

High-impact setup areas

Area	Control expectation
Savings, investment and loan products	Use approved product specifications; independently review rates, limits, terms and charge settings.
Chart of accounts and mappings	Use the approved accounting structure; validate downstream posting behaviour.
Charges, levies and commissions	Confirm amount/rate, bearer, recovery mode, effective use and any exemptions.
Posting periods	Keep dates and open/closed status aligned with the finance calendar.
Tellers, treasuries and bank linkages	Verify assignment and currency/branch context before operational use.
IRREVERSIBLE PROCESSING Posting-period closing creates fiscal closing journals. Perform it only under an approved finance procedure, after reconciliation, backup and supervisory sign-off.	

8. Front Office operations

Teller receipts and payments

Savings Receipts/Payments supports the main teller cycle, including deposits, withdrawals, cheque deposits and payment vouchers. The active transaction type controls the fields and processing route.

1. Confirm you are assigned to the correct teller/treasury and operational date.
2. Choose the transaction type.
3. Search for and select the customer/account; verify identity and account status.
4. Enter the amount, instrument/reference and required narrative.
5. Review the transaction summary, especially debit/credit direction and cash versus cheque treatment.
6. Submit once, retain the generated reference and issue the approved receipt or voucher.

Treasury and cash management

- Cash Management controls teller/treasury cash movements.
- Cash Withdrawal Requests follow a create, browse, authorise or reject lifecycle.
- Fiscal Counts provide a read-only catalogue for recorded counts.

Other Front Office functions

Function	Key check
Transfers	Select Cash or Cheque and verify both source and destination.
Cheques	Confirm the active Catalogue, Bank or Clear tab and cheque status.
Fixed deposits	Confirm product/type, term, maturity instruction and funding account.
Expense payables	Confirm beneficiary, expense purpose, amount and approval evidence.
Account closure	Confirm the account, balance treatment, charges and required authorisation.
In-house cheques	Verify drawer, payee, account, amount and instrument details.
Automated clearing	Validate source file/batch, totals, duplicates and processing result.

CASH CONTROL Never share tills, teller credentials or transaction references. Count cash in accordance with the organisation's dual-control and till-balancing procedure.

9. Loans and check-off

Loan-case lifecycle

The configured loan-case pipeline separates duties across Registration, Appraisal, Approval, Verification/Audit and, where necessary, Cancellation.

Stage	Primary responsibility
Registration	Capture the applicant, requested facility, purpose, product and supporting details.
Appraisal	Assess eligibility, affordability, security, guarantors, income adjustments and policy compliance.
Approval	Record the authorised decision and terms within delegated limits.
Verification / Audit	Independently confirm evidence and approved terms before disbursement processing.
Cancellation	Cancel only an eligible case, with a documented reason and correct authority.

Guarantors and restructuring

- Guarantor Attachment supports attachment, substitution and relieving/history workflows.
- Guarantor Management adds a guarantor to an already registered case.
- Restructuring is account-based; confirm the customer account and approved revised terms.

Check-off workflow

1. Create or confirm an open data period.
2. Capture/import entries against the correct customer product accounts.
3. Reconcile control totals and exceptions.
4. Close the period only after review and approval.
5. Use Catalogue for read-only follow-up and evidence.

10. Batch procedures and approvals

Batch stages

Batch procedures use three controlled stages: Origination, Verification and Authorization. Each stage may include multiple batch-type tabs.

Stage	Operator check
Origination	Correct batch type, source, period, row count, control total and duplicate check.
Verification	Independent comparison to source evidence; investigate all rejected or unmatched lines.
Authorization	Authority, totals, exception resolution, accounting date and final release decision.

Command Hub approvals

1. Open Command Hub > Approval Requests.
2. Filter or select the pending request.
3. Open the detail and verify the originator, action, target record, amount and supporting context.
4. Approve or reject according to delegated authority. Enter a useful reason when required.
5. Confirm the resulting status and retain evidence where policy requires it.

SEGREGATION OF DUTIES An originator should not verify or authorise the same transaction unless the organisation has explicitly approved that control model.

11. Reports, statements and messaging

Run a report

1. Choose the report family: Loan, Financial, SASRA, Member Statement or User-Defined Reports.
2. Set the customer, branch, account, period and other filters as applicable.
3. Review the parameters before generating the report.
4. Compare headline totals with the relevant register or control account.
5. Export only when necessary and store the file in an approved location.

Statements

Customer Account Statement and Member Statement functions may offer preview, mini/full statement or PDF output. Confirm the customer and account identifiers before displaying or distributing the statement.

Messaging

Function	Guidance
Text alerts	Review the alert history/reference information available to your role.
Email alerts	Use history/detail/compose functions; verify recipients and attachments before sending.
Instant messaging	Use authorised direct or group conversations; do not place passwords or unnecessary sensitive data in messages.

CONFIDENTIALITY A report or statement remains confidential after export. Check recipients, file permissions and retention requirements before sharing.

12. Administration

Administration functions are intended for designated system administrators and control owners.

Function	Administrator responsibility
Users	Create and maintain named accounts; disable leavers promptly; avoid shared accounts.
Roles and permission types	Apply least privilege and obtain business-owner approval for access changes.
Modules	Maintain the navigation/permission catalogue carefully; test visibility after change.
Workflows	Configure stages and approvals in line with delegated authority and segregation of duties.
Company, branches and locations	Keep organisational master data current and avoid duplicate records.
Banks and bank branches	Validate identifiers and linkages before financial use.
Audit logs	Use for investigation and review; preserve evidence and restrict access.

Access review checklist

- Review privileged roles and dormant accounts regularly.
- Reconcile joiners, movers and leavers against approved HR records.
- Test that a sample user can see required pages and cannot see restricted pages.
- Retain the access request, approval and implementation evidence.

13. Troubleshooting

Problem	Safe response
A list remains empty	Check filters and page number. Confirm you have permission and that the record exists in the selected branch/period.
A save fails	Read the alert, preserve entered details, correct validation errors and retry once.
A request times out	Do not immediately repeat a financial action. Search the register/journal first.
Wrong record was selected	Cancel before submission. If already submitted, stop and follow the approved correction/reversal process.
Unexpected status	Refresh/reopen the record and check workflow history. Escalate with the reference and timestamp.
Permission or navigation issue	Capture the page name and required duty; ask the role administrator to review access.
Persistent system error	Record the user, time, page, action, reference and exact message; provide a screenshot without exposing passwords.

Support ticket minimum information

- Your name, username and branch - never your password.
- Date/time and application page.
- What you were trying to do and the steps immediately before the error.
- Customer/account/transaction reference, masked where appropriate.
- Exact error message and a safe screenshot.
- Whether the action appears in the relevant register or journal.

14. Daily operating checklists

Start of day

- Sign in with your own account and confirm the correct permissions.
- Confirm branch, operational date, posting period and teller/treasury assignment.
- Check opening cash or control balances according to local procedure.
- Review pending approvals, failed batches and unresolved exceptions.

Before every financial submission

- Correct customer and account.
- Correct transaction type and debit/credit direction.
- Correct amount, currency, date and instrument/reference.
- Required evidence and approval are present.
- No duplicate transaction or batch exists.

End of day

- Complete pending items or formally hand them over.
- Reconcile cash, transaction totals, batch totals and exceptions.
- Confirm all required authorisations or rejections have been recorded.
- Run and retain approved end-of-day reports.
- Use the Front Office End-of-Day function only when operational prerequisites are complete.
- Sign out and secure printed/exported information.

LOCAL PROCEDURES PREVAIL This guide explains application use. Your organisation's finance, cash, credit, privacy, approval and records-management policies remain mandatory.

15. Support and handover details

Contact	Details
Business system owner	[Name / role / email / telephone]
First-line support	[Help desk / email / telephone / service hours]
Technical escalation	[Supplier / developer contact and escalation route]
Security incident	[Security contact and urgent reporting method]
Production URL	[URL]
Training environment	[URL, if available]

Client acceptance
